GPS Basics

- **GPS = Global Positioning System**

- *Worldwide radio-navigation and timing system*
- *Constellation of 24 satellites with atomic clocks*
- *Calculates position utilizing the “Triangulation” concept*
 - *Measures signals from three satellites, and uses a fourth one to compensate for errors*
 - *Signals are corrected for any delays as it travels through the atmosphere*

- **Accuracy**

- *Position*
 - *Within meters for most applications*
 - *Within centimeters for advanced applications (i.e. Military)*
- *Timing*
 - *10 – 100 ns*

- **GPS Receivers**

- *Available in multiple form factors including integrated circuits*

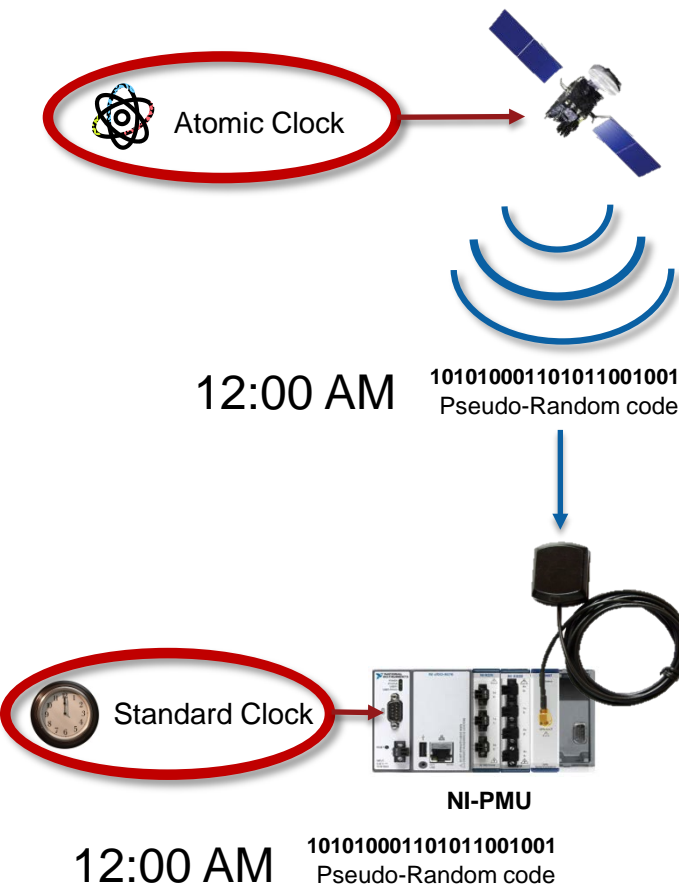

- **Applications**

- *Wide range of applications (scientific, financial, military, social networks, navigation, etc.)*

Making Every Receiver a "Virtual" Atomic Clock

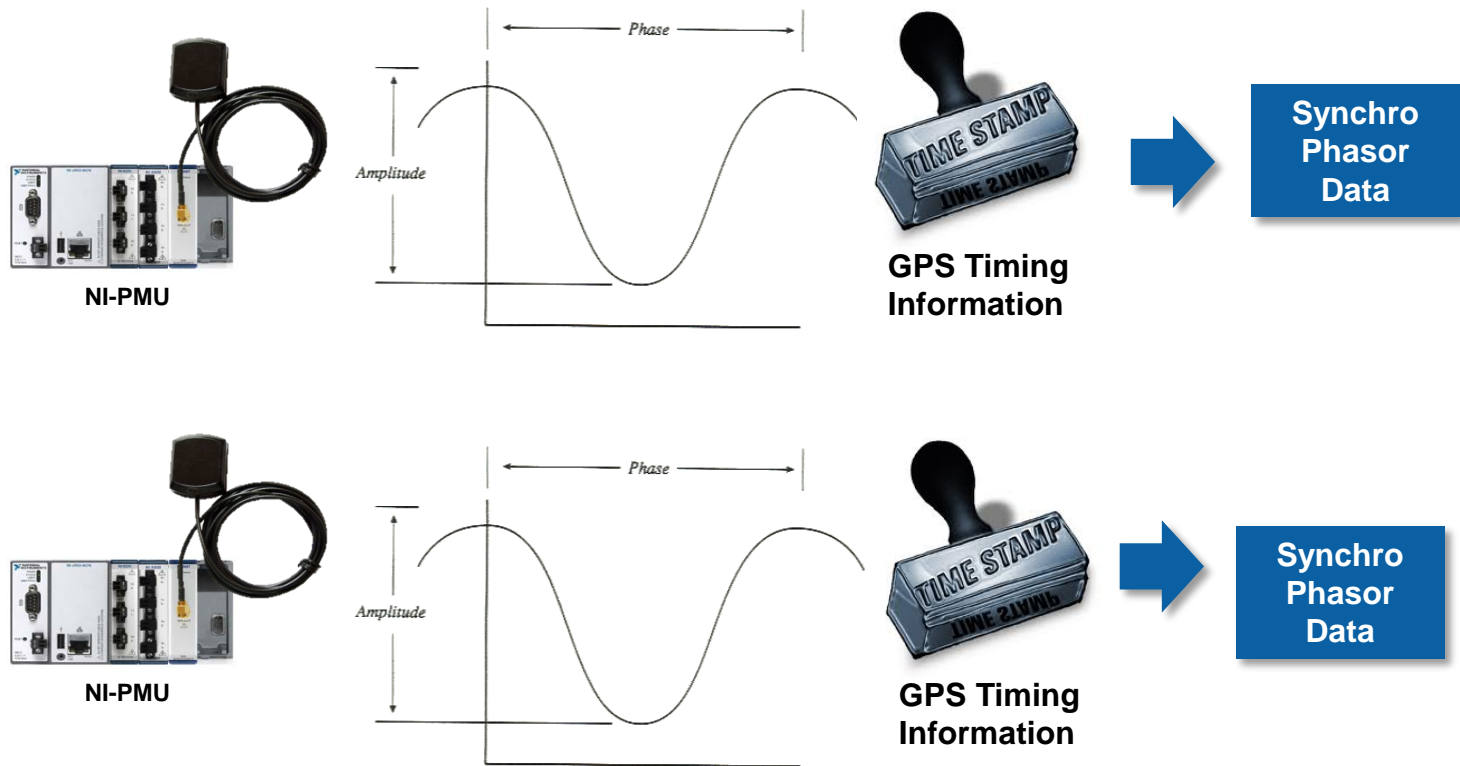

Because GPS Receiver clock is inaccurate, distance to satellite is also very inaccurate!

$$\text{Misalignment} \times \text{Speed of Light} = \text{Distance to Satellite}$$

How PMU's utilize GPS Timing

- **Two types of PMUs**

- External GPS Source: Depends on external device to monitor and take action in the event of GPS signal issues
- Built-in GPS: Has more flexibility to monitor and take action in the event of GPS signal issues

Potential GPS Issues

- **Natural or intrinsic issues**

- Atmospheric effect
- Multipath effects
- Artificial degradation of the satellite signal

- **Malicious attacks**

- Broadcasting noise on the same frequency as the satellites
- Broadcasting signal with false information
- Etc...

- **Counter measures**

- Amplitude discrimination
- Time-of-arrival discrimination
- Navigation inertial measurement unit (IMU) cross-check
- Polarization discrimination
- Angle-of-arrival discrimination
- Cryptographic authentication
- Etc...

Likely to continue to evolve!

Smart Grid-Ready Instrumentation

Computers

- Processing Power
- Open Source
- I/O Expandable
- Programmable
- Software-Defined

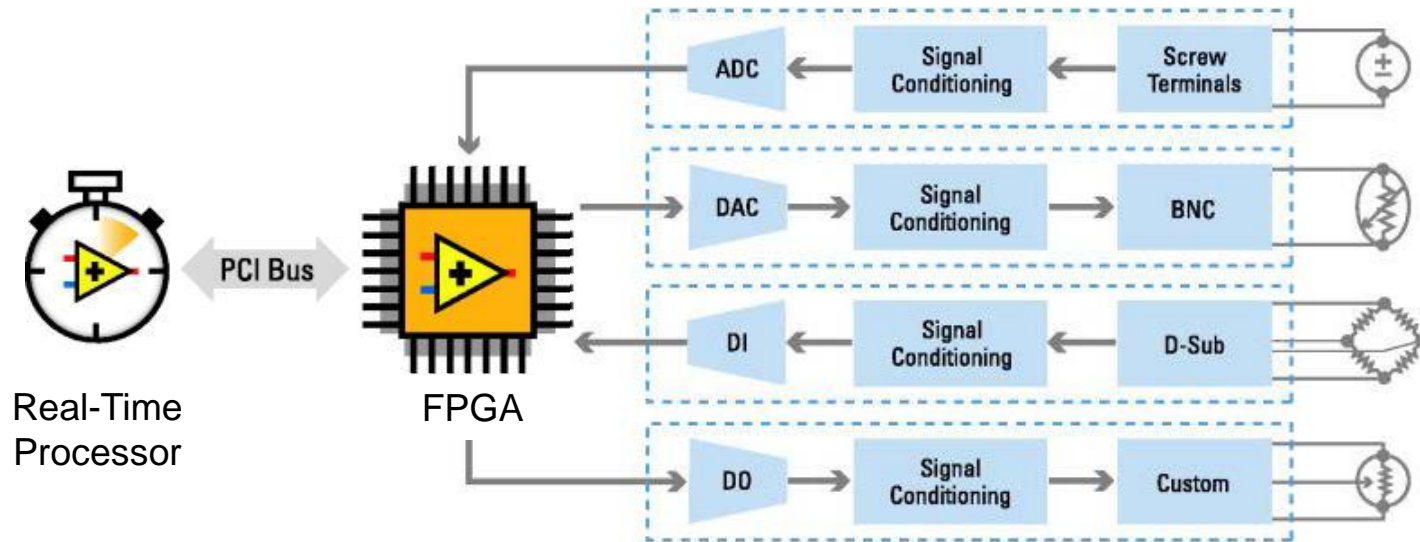

- Measurement Quality
- Embedded Processing Power
- Reliable and Robust
- Open source and Programmable
- I/O Expandable and Standards-Based
- Software-defined

T&D Instrumentation

- Measurement Quality
- Embedded
- Reliable and Robust
- Standards-based
- Vendor-Defined

Smart Grid Ready Instrumentation an FPGA-based Platform

- **Reconfigurable FPGA** for high-speed and custom I/O timing, triggering, and control
- **I/O modules** with built-in signal conditioning for connection to sensors/actuators
- **Real-time processor** for reliable measurement, analysis, connectivity, and control

BOTTOM LINE: FPGA-Based platform provides flexible instrumentation that adapts to changing requirements and allows custom algorithms to check and monitor abnormal GPS variations

NI FPGA PMU

period detector settings synchronization error [ns] FIFO1 timed out?

1. Checks the GPS status of NI 9467 and waits until the GPS status is normal.
2. Synchronizes the time from NI GPS with the time from timekeeper.

Summary

- **There is no silver bullet to defend from GPS issues**
 - *Malicious vs. Nature related causes*
 - *Most likely a continuous effort (Anti-virus analogy)*
- Time-Keepers constantly **monitors the “Quality” of various time sources** and selects the one that is most appropriate at any given time.
- **Smart-Grid Ready Instrumentation** that adapts as needs evolves, without asset replacement, **is key for future-proofing our infrastructure**
