# SwRI® Today

- San Antonio, Texas
- About 3000 Employees
- 1,200 acre facility
- Research and Development
- Multidisciplinary Expertise

# Agenda

## 1. PMU Overview

- Clock Synchronization
- GPS Vulnerabilities

## 2. PMU Hardware Setup

- Test Results

## 3. Solutions

- Test Results

# Clock Synchronization

# GPS Vulnerabilities

# What Does This Mean?

- Jamming/Spoofing GPS is EASY
- GPS is not likely to change
- We want to Protect GPS
  - But,
    - Protecting RF is an EXPENSIVE option
    - The RF Attack Surface is LARGE
    - Many attacks have not been shown YET

# SwRI PMU Test Setup

- Jitter
- Fast Spoofing Drift
- Slow Spoofing Drift

- Jamming

# Attack Test Results

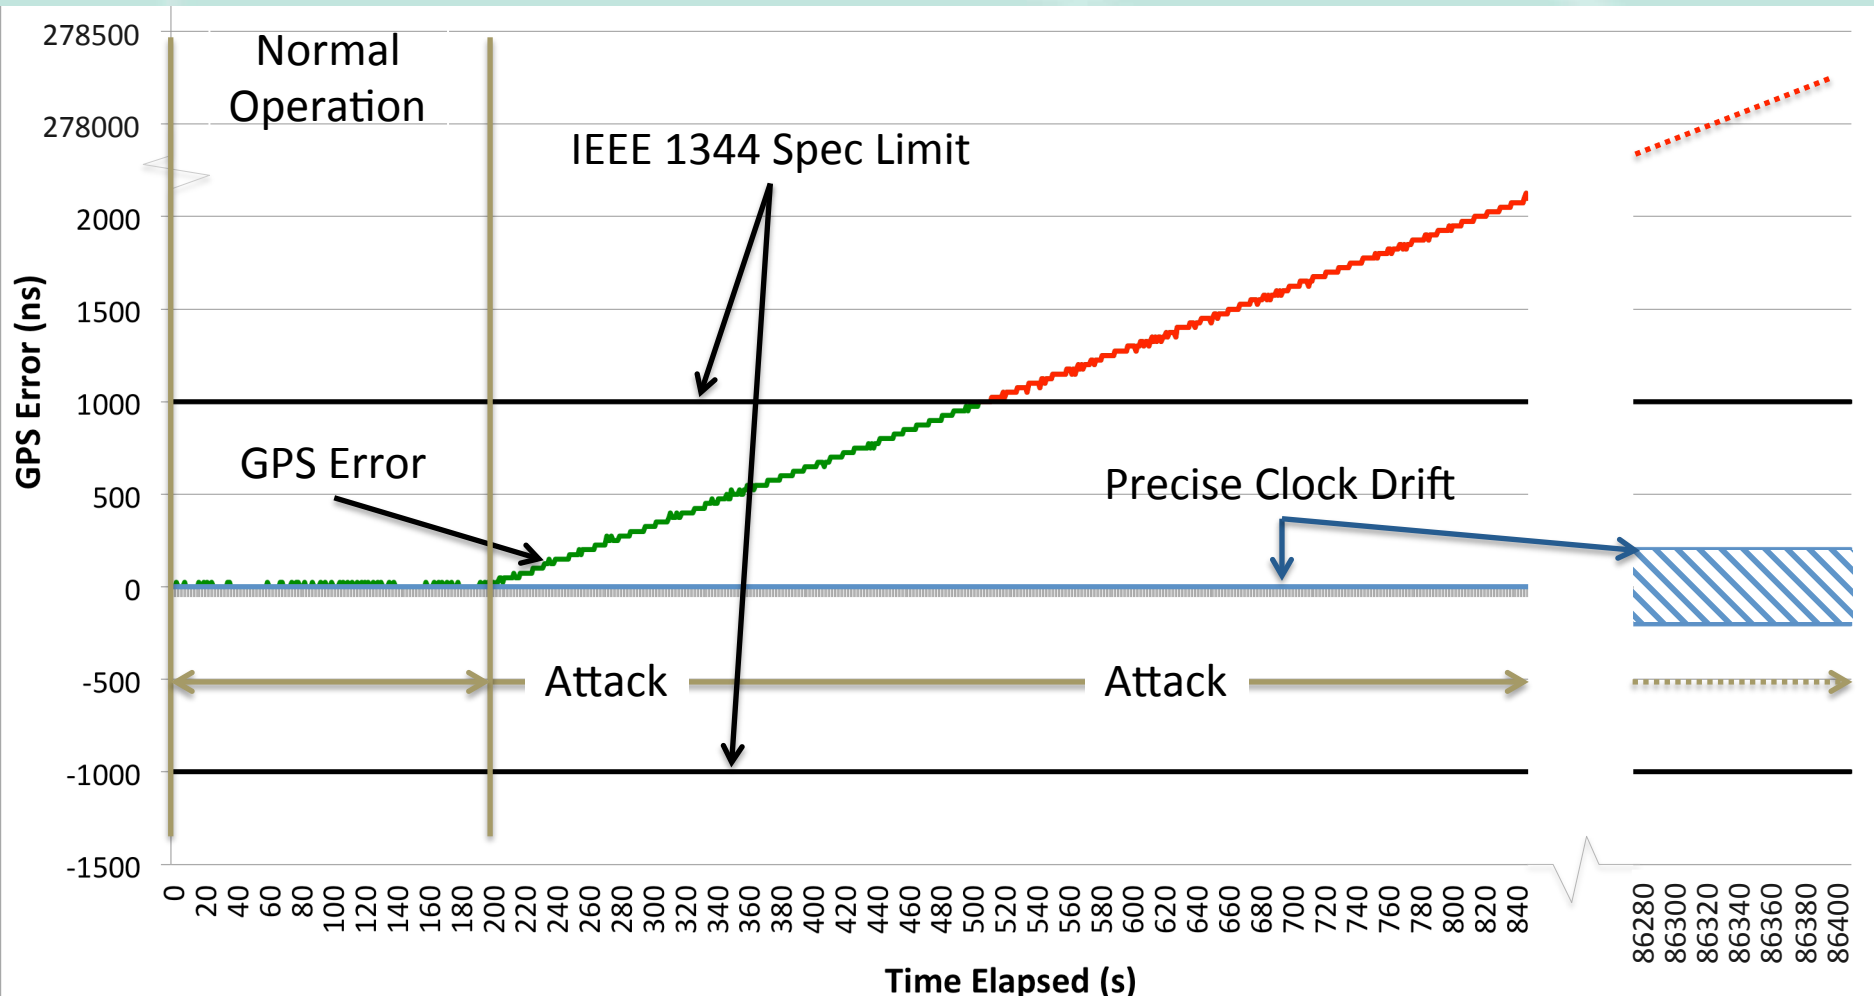

# What We Have Done

- Options: Algorithms and/or Hardware

	Spooof Detection	Max Withstand (Hold-off)	Cost
Option 1: Anomaly Detection Algorithm	Some fast attacks	10's of Seconds	\$
Option 2: Standard Clock Reference	All attacks	Minutes	\$\$
Option 3: Precise Clock Reference	All attacks	Days	\$\$\$
▪	▪	▪	▪
▪	▪	▪	▪
▪	▪	▪	▪

# Slow Spoof vs. Option 3

86400 = 24 hrs

# Key Takeaways

- **No silver bullet to defend from GPS attacks**
- **GPS is widely used** from financial institutions to global navigation and time synchronization, **and it is unlikely to change in the near future (\$\$\$\$).**
- Detecting attacks solely based on RF analysis (time averaging, etc.) has limited utility.
- FPGA Technology can be used to constantly **monitor in real-time the “Quality” of various time sources** and select the one that is most appropriate at any given time.

**THANK YOU!**
