

PMU ANALYTICS

Archiving Strategies

Tom Anderson – Principal Systems Engineer, SAS

NASPI Work Group Meeting

San Diego, CA

April 15-17, 2019

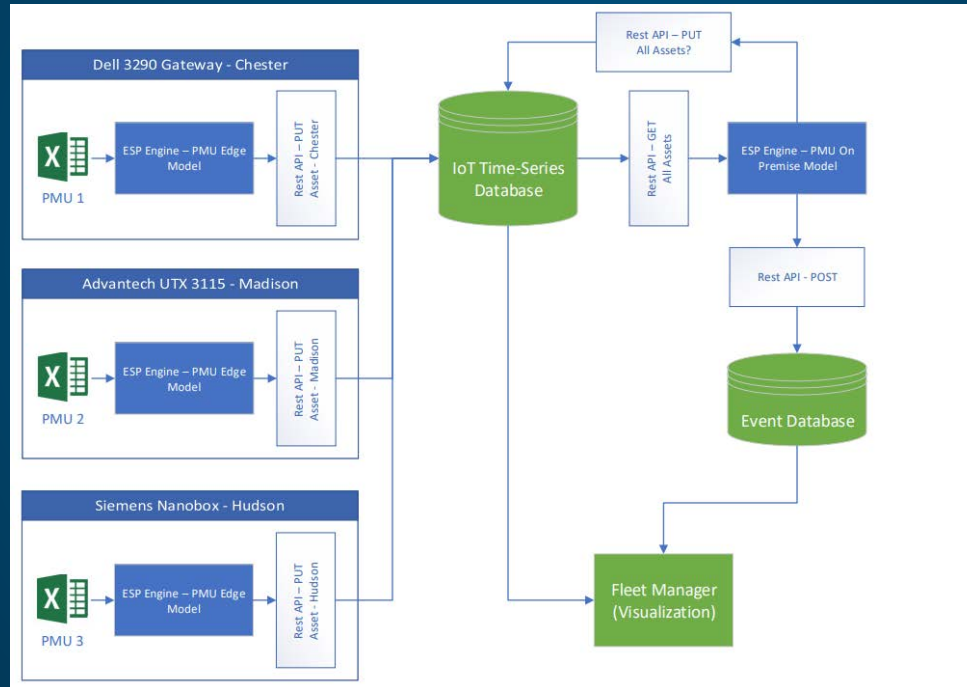

Archiving Strategy

Archiving Time Series and Events

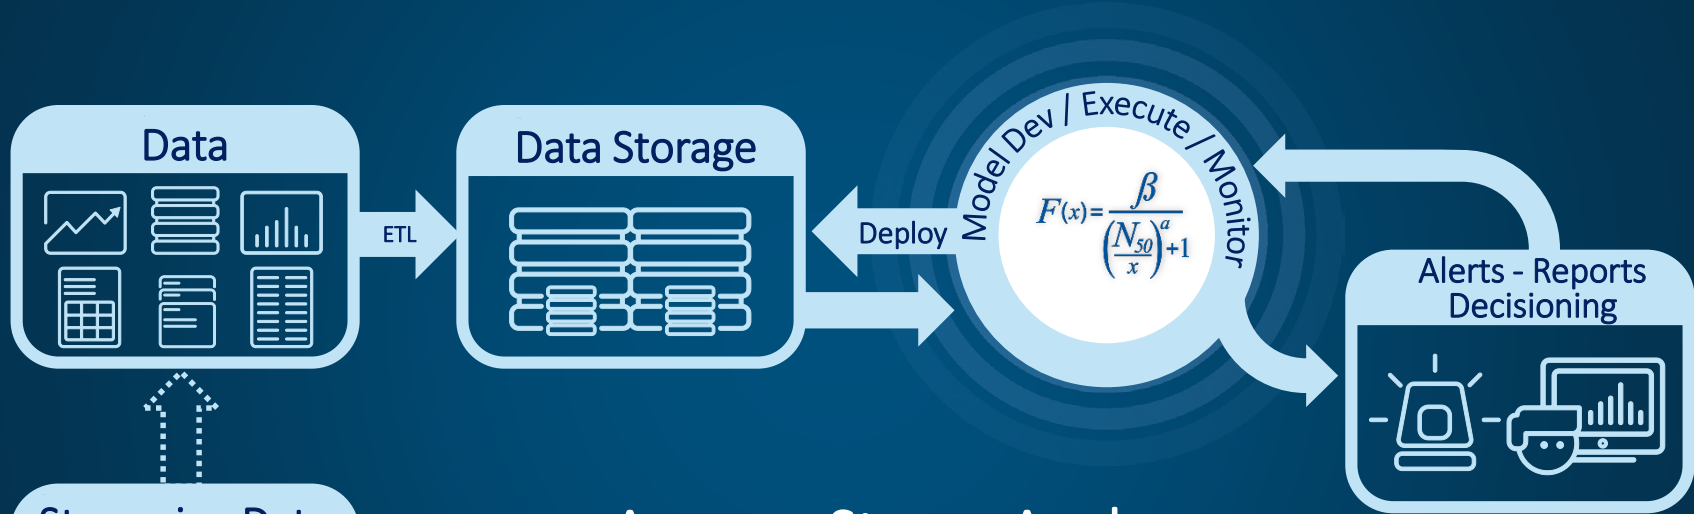

Edge Devices

On Premise/On Cloud

Analytics Lifecycle

Traditional Analytics Lifecycle

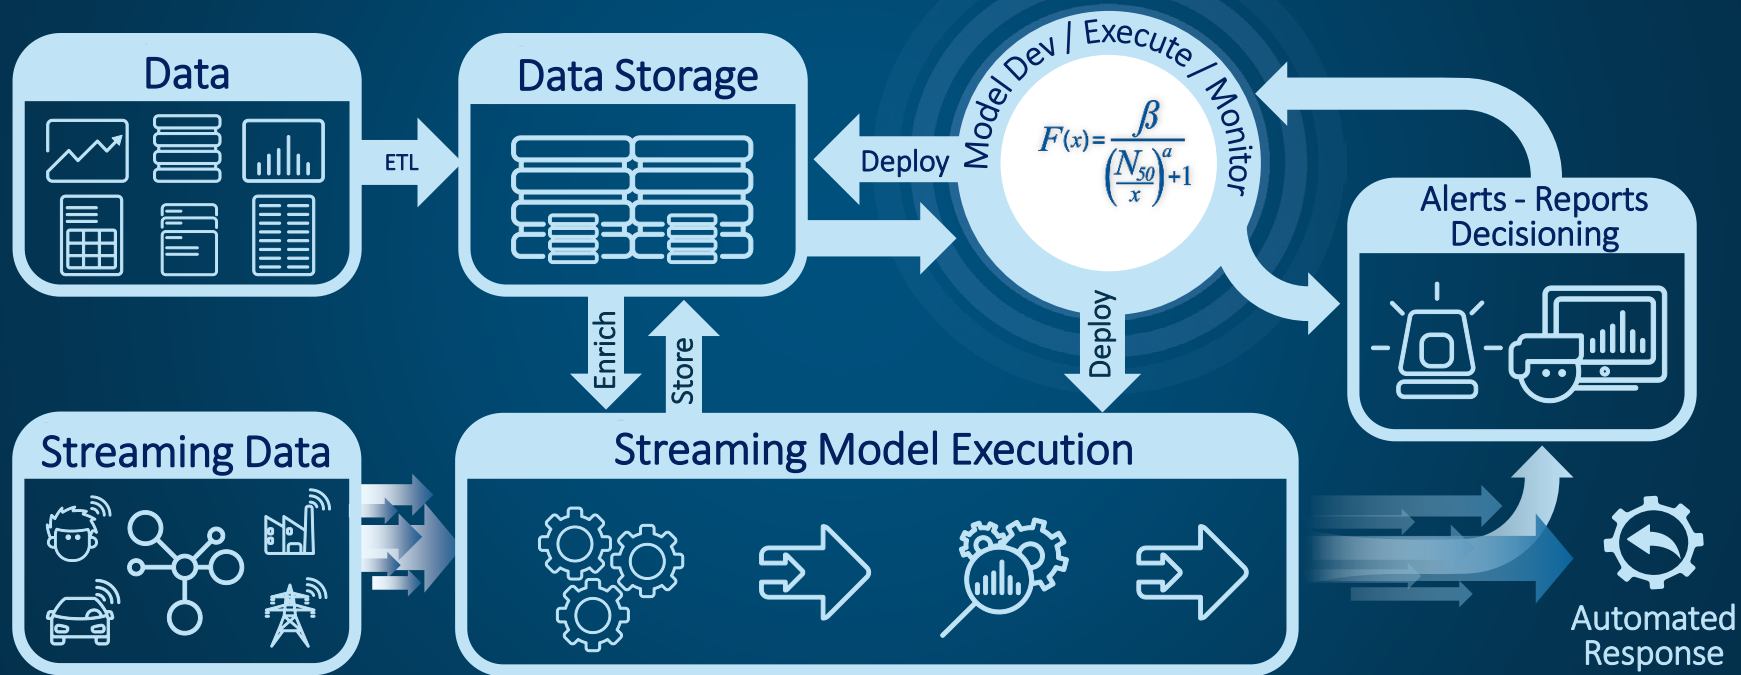

Access - Store - Analyze

1. Latency ... Data analyzed after the fact
2. Information not always actionable
3. Reduced benefits/value

Analytics Lifecycle

IoT Analytics Lifecycle

Archiving PMUs

Key Points

- Fast** — Millions of events/second — sub-millisecond latency on commodity hardware
- Agile** — From lightweight embedded technology to cloud distributed architecture
- Flexible** — Flow Based Modeling for fast adaptation to change
- High End Analytics** — SAS® most advanced analytics and machine learning
- Analytics at the Edge** — Brings analytics closest to the event source.
- Enterprise Class** — Seamless integration with existing IT architecture and open source

Architecting Streaming Analytics

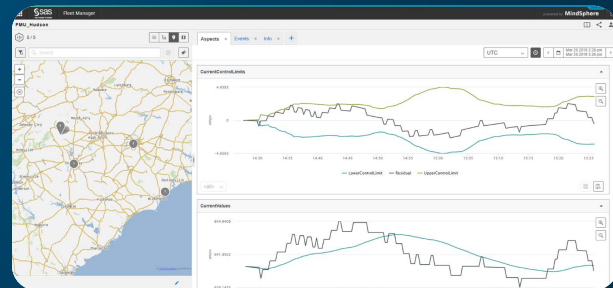

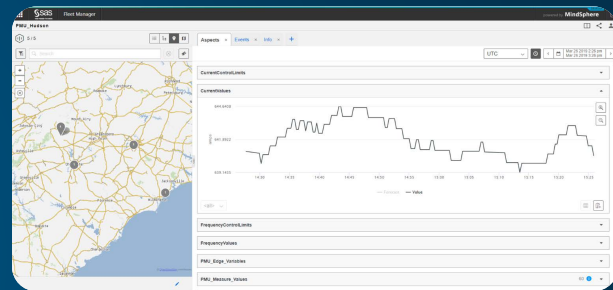

Processing PMU High Speed Data

- **Challenge:**

- SOC center SCADA observability versus PMU measures at edge
 - Samples per second (PMU 30-120 samples per sec)
 - Time Synchronization (GPS)
 - Measured Aspects (SCADA – Magnitudes ; PMU – Magnitudes and phase angles)
- Detection of events that occur within engineering specs
 - Frequency varies within engineering specs
 - Data points are highly auto-correlated

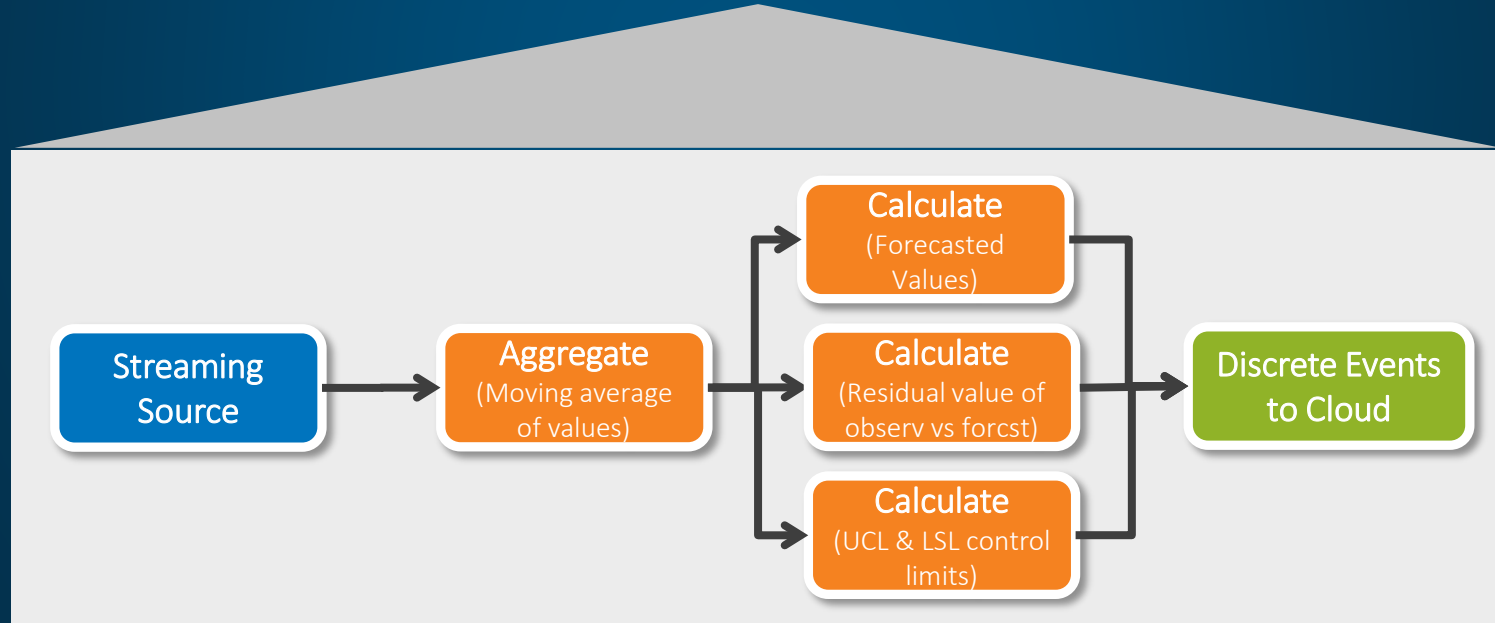

- **Solution:**

- Real-time forecast of expected values and detect deviations
 - Expected value based on time series model
 - Residual differences from expected values with Upper & Lower Spec limits

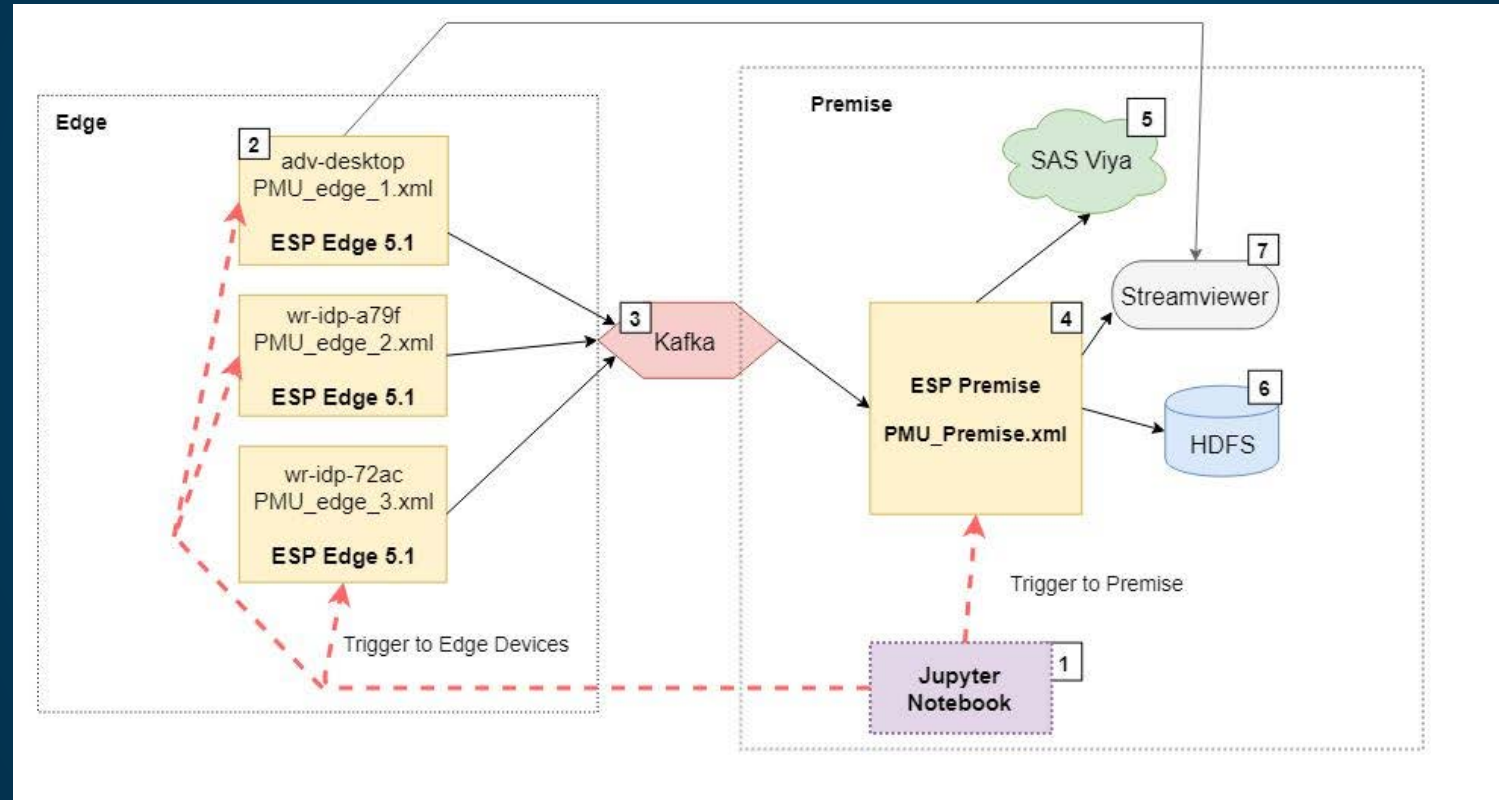

Edge Streaming Analytics

Processing PMU High Speed Data

Edge Streaming Analytics

Architecture Overview

Grid Stability Design Example

Archiving Time Series and Events

Edge-to-Enterprise IoT Solution using SAS Event Stream Processing (ESP)

Edge Devices

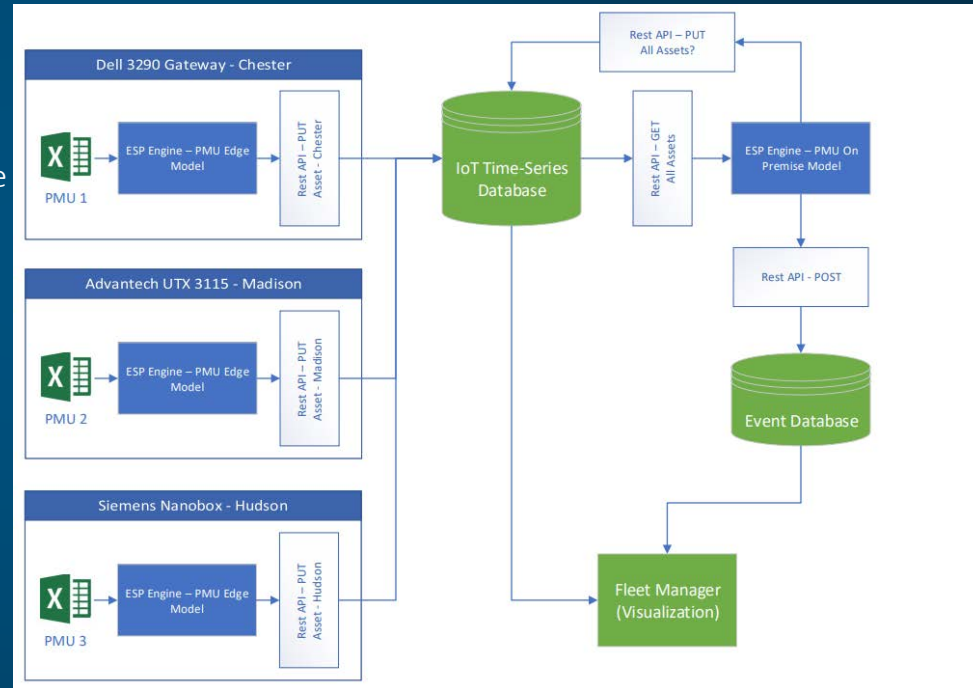

- Historical data captured for Phasor Monitor Units (PMUs) at different locations
 - Data captured includes Frequency, Current, Voltage on Grid
- ESP Model enriches the data to send back into On-Premise Model

On-Premise / Cloud

- All PMU data sources are analyzed to determine abnormalities within grid
 - SPC processing determines individual excursion of signal
 - Clustering technique (DBSCANS) processes excursions to see if a sudden occurrence of events happened in short time period
- Outputs both events and time-series data
